Subject: Michigan Plaza: Upgradient Area City Directories' Search

Erin,

Thanks again for keeping us posted on the MCHD well testing west of our Site, and also of EPA's involvement. Hope things are going well.

We believe the attached **Figure A** depicts the area where the MCHD did find VC impacts. In order to look into these chlorinated solvents impacts west of the site, MUNDELL performed a detailed city directories' search of this upgradient area (see attached **Figure 1**). The purpose of the compilation of this data (see attached **Table 1**) is to provide property use information to facilitate the identification of potential sources of petroleum and chlorinated solvents' contamination since 1960. Given EPA's involvement, this city directories' evaluation will help in the 'separation' of the PCE impacts from the plaza from this 'area of concern'. The attached write-up and **Table 1** together demonstrate that there can be quite a few other potential upgradient contributors to any chlorinated solvent impacts on the west side that the health department and/or EPA are looking into.

Thanks Erin, and hope you are having some good time off. I will call after Wednesday next week regarding this and also the upcoming quarterly reports.

Best,
Leena

Subject: Allison Plant 10/Michigan Plaza

Hi Leena,

Just FYI—I received the quarterly for Allison Plant 10 and the VFC # is 50168651.

Also, recently the Marion County Health Department conducted some sampling in residences on Vermont and Cossell Streets. They identified homes in the no well zone with private drinking water wells. They still have several homes to sample but so far 2 homes have had VC impacts. Since these homes are across Holt Street and away from Allison Plant 10 and Michigan Plaza, I don't think the impacts are coming from either site. However, the EPA is now involved and looking into whose

contamination might be impacting these wells. Just a heads up that I might need to spend quite a bit of time on these two sites.

Thanks,

Erin Brittain
